# Overview

## Introduction

The 8180 SIP Audio Alerter is a SIP compliant & multicast IP speaker for loud ringing, alerting, and voice paging. The 8180 can be integrated with any Communication Server (hosted or enterprise) that supports 3rd party SIP Endpoints or multicast paging.

For loud ringing, the 8180 is assigned a SIP extension. When the SIP extension is called the 8180 will play a WAV file (ring tone) over the speaker. Several ring tones are included in the 8180 and custom WAV files may also be uploaded. For extra volume, noisy, or wet locations, the optional 1186 horn speaker can be used. More features are available under advanced settings for multiple ring extensions and rules-based ringing based on CLID.

For voice paging, a separate SIP extension can be assigned. When that extension is called, the 8180 will auto-answer and play the callers voice the speaker. The 8180 supports G.722 wideband HD Voice for enhanced intelligibility and clarity.

Multicast feature allows one 8180 to broadcast page or ring audio multiple slave 8180s. This allows a scalable and cost effective means of building large scale paging and alerting solutions with minimal network traffic and as few as one SIP extension

## Key Features & Capabilities

### *Loudness*

Equipped with a high efficiency integrated amplifier and tuned high quality loud speaker, the 8180 is typically eight times louder than a telephone speaker. If the optional Algo Horn Speaker is used, then the 8180 can be 20 times louder.

## ***Multicasting***

Allows multiple units to simultaneously ring or play a page audio stream. One 8180 may be configured to broadcast an audio stream (master) to other 8180s configured as multicast slaves. This feature provides scalability without requiring each 8180 to be registered as a SIP extension.

## ***Ambient Noise Compensation***

The 8180's SoundSure™ technology automatically adjusts loud ring and paging volume to compensate for background ambient noise. If SoundSure™ is enabled, the alert volume will get louder or quieter by the same dB level as the ambient noise measured just prior to the alert.

## ***Outputs for External Equipment and Devices***

Outputs for external speaker, slave amplifier, or visual alerter plus multicasting capability enable many more options to enhance notification and alert capabilities.

## ***Configuration & Provisioning***

Configure the 8180 through a web interface control panel or by using the program buttons on the back of the unit. Central provisioning may also be used to allow units to be preconfigured for a specific server prior to deployment in the field. Configuration files are automatically downloaded from a server (via TFTP, FTP, or HTTP) using DHCP.

## ***Paging Talkback***

Allows bidirectional communication between the 8180 and the phone. Talkback is ideal for confirmation that page announcements have been received.

## ***Ring Tones***

Several audio files are pre-loaded into the 8180 internal memory for ring sounds. Users may also record or upload custom audio files, music, sound effects, or voice announcements.

## ***Blue Indicator Light***

This LED light is on during initialization, boot, message waiting or while active. Ring and Page modes, when active, will turn the LED on steady. If the optional Talkback mode is enabled, the LED will flash instead (during a page event) to provide a clear indication that the microphone is active. If Message Waiting is supported and active, the light will flash, or be on steady (depending on its setting). The LED heartbeat option, when enabled, will flash the LED every 30 seconds as visual confirmation of PoE power and SIP server registration.

## ***SIP Extensions***

The 8180 connects to an on-premise or hosted communication server in the same way as a SIP telephone. To register the 8180 with the server requires the following information:

1. IP address (eg 192.168.1.1) or domain name (eg myserver.com) of the SIP Server
2. SIP extension (eg 3790)
3. Password

The 8180 supports two SIP extensions which behave differently – RING and PAGE. One or both may be used depending on the application. If the RING extension is called the 8180 will not answer. Instead it will play the selected WAV file until the ringing stops. Typically the RING extension is programmed as part of a hunt group so that it receives ring signal simultaneously with one or more phones to function as a loud ringer in noisy or large areas.

If the PAGE extension is called, the 8180 will answer and allow paging over its internal speaker. When the 8180 answers it will play a configurable tone to the caller so they know when they can begin speaking. A pre-announce tone is also sent over the speaker. If Paging to a single 8180, talkback may be enabled using the integrated microphone. The audio direction is determined by the speech activity of the caller.

## Front and Back Views

# Setup and Installation

## Wall Mounting

Mount the wall bracket securely and snap the 8180 into the bracket by engaging the top and then pushing the bottom firmly into place. To remove the 8180 from the bracket, press firmly on the tab of the bottom catch, then lift the cover.

## Outputs

### *Relay*

May be enabled for ring, paging or both to activate a visual alerter, mute background music, or enable a slave amplifier.

### *Auxiliary Speaker*

For connection to the optional Algo horn speaker (e.g. for outdoor/wet locations) or to ceiling speakers wired in a series-parallel configuration to maintain minimum 8  $\Omega$ . The presence of an external speaker(s) will automatically disable the internal speaker to preserve power.

### *Audio*

High impedance output for driving 600  $\Omega$  load up to 0 dBm. Internal speaker may be active simultaneously, but levels cannot be adjusted separately.

## Programming and Configuration

Primary configuration of the 8180 is through the web interface control panel. In addition, there are program buttons on the unit itself for basic setup options.

### ***Connection to Network and Obtaining IP Address***

After connecting the 8180 to a network PoE port, the blue indicator light will turn on during initialization. The 8180 will then attempt to obtain an IP address from the DHCP server. If unsuccessful, the 8180 will default to the fixed IP address 192.168.1.111. When the IP address is selected, the 8180 will chime and turn off the blue light.

If you don't have a PoE switch, you'll need a PoE injector that installs between the 8180 and network switch. The PoE injector will supply 48 Vdc to the 8180. Most PoE injectors are capable of providing more power than the 8180 requires (12.95 W). Ensure that the PoE injector is fully compliant to the IEEE 802.3af standard.

### ***Web Interface Control Panel***

The 8180 is configured using a web interface tool accessed by entering the 8180 IP address into a browser.

To find this IP address, press the Menu button until the option for "IP Address" is reached. Then press Select to hear the address. Alternatively, search the network using the Algo Network Device Locator Tool available for download from [www.algosolutions.com/locator](http://www.algosolutions.com/locator).

## Program Buttons

The Program buttons on the back of the 8180 allow local adjustment of alert tones and alert volume. The buttons are intentionally hidden from view after installation and can be disabled using the web interface.

The ► button plays the current ring tone and allows volume adjustment using the ▼ and ▲ buttons. Press ► to exit.

The ☰ button steps through the following three options:

1. Choose ring tone
2. Record ring tone using microphone
3. Get device information (IP address and MAC address)

Press the ◀ button to choose option or ► to exit.

## Soft Reset

A soft reset will restore all device settings back to the original factory default conditions. To do this, disconnect the network cable from the 8180. Push and hold the Volume Down button and reconnect the network cable. Hold the button until the front light flashes three times.

# Web Interface Control Panel

Using the SIP Audio Alerter web interface control panel, configure the 8180 network settings and select the desired options. These settings survive power cycling and may be programmed in advance prior to site installation.

After changing settings, click Save (in the bottom right corner of the window). Note that this may end any active call.

## Basic Settings

### SIP

Firmware version 2.4 has introduced new SIP options for notification and ring, according to the Ring/Alert Mode chosen under the Basic Settings → SIP tab.

#### ***Monitor “Ring” Event (default)***

In this mode the bottom of the page will request credentials for a SIP Ring extension. When this SIP extension is called the 8180 will play the audio file selected under the Basic Settings → Ring tab.

#### ***Subscribe/Notify (dialog)***

In this mode the 8180 will communicate with the SIP server to receive status information for another phone/device/extension connected to the system. The server must support Subscribe/Notify per RFC 4235.

The Ring/Alert Extension is the extension to be monitored for events, and the event of interest (ring or in-use or both) can be selected under Ring/Alert Events. While the event is active, the 8180 will play the audio file selected under the

Basic Settings → Ring tab continuously. Custom WAV files may be padded with silence to achieve the desired notification frequency.

Note that for Subscribe/Notify to work a SIP extension is required for the

8180 itself. If the Page Function is enabled then the Page Extension will provide the necessary access. If Page Function is disabled, then the web page will request a SIP Extension to support Subscribe Notify.

### ***Subscribe/Notify RFC (presence)***

As above, but supporting Subscribe/Notify per RFC 3856/3863. The only event supported is “On the Phone” so there is no Ring/Alert Event to select.

### ***Call to Cancel***

This mode provides a method to trigger the 8180 with a ring or relay input. The 8180 will play the audio file selected under the Basic Settings → Ring tab continuously until a cancel event is received by dialling the Ring Extension.

The SIP extension used to trigger the 8180 can be configured using the Advanced Settings → Advanced Ring/Alert. A ring event on extension 2-5 will trigger the 8180 when in this mode.

Typical applications for this mode are for safety and emergency notification, or latched alarms for door openings and other relay events.

### ***None***

Select this mode if the 8180 will not be used for ring or event notification.

## SIP Settings

Here you can configure the basic SIP settings.

SIP

SIP Domain (Proxy Server)   
Default port is 5060. To specify a different port, enter PROXY:PORT, e.g. my\_proxy.com:5070, or 192.168.1.10:5080.

Ring/Alert Mode  
 Monitor "Ring" event on registered SIP extension  
 Use "Subscribe/Notify" dialog event (RFC 4235) to monitor event on different extension  
 Use "Subscribe/Notify" presence event (RFC 3856/3863 PIDF) to monitor event on different extension  
 Call to Cancel (start activation upon Ring event on Ring Extensions 2-5 [or relay input], and latch until main Ring Extension is called)  
 None  
Server support required on "Subscribe/Notify" events

Page Function  Enabled  Disabled

Allow SIP REGISTER  Enabled  Disabled  
Disable it when connected in trunk mode

Ring Extension

Authentication ID

Authentication Password

Page Extension

Authentication ID

Authentication Password

Different Ports for Extensions  Enabled  Disabled  
Turn this option on for certain proxies, e.g. Cisco Communication Manager 7, to send ring and page SIP requests through different port numbers.

## With Subscribe / Notify Activated

Ring/Alert Extension

Ring/Alert Events

Page Extension

Authentication ID

Authentication Password

<b>SIP Domain (proxy Server)</b>	SIP Server Name or IP address
<b>Ring Alert Mode</b>	Choose between basic SIP ring, Subscribe/Notify for monitoring phone events, or call to cancel. See Basic Settings SIP
<b>Page Function</b>	Enable or disable PAGE extension for SIP voice paging.
<b>Allow SIP REGISTER</b>	Normally enabled. Can be disabled for operation as a SIP trunk.
<b>Ring Extension</b>	Extension name that will be monitored to activate the 8180 ring.
<b>Ring Authentication ID</b>	Authentication ID; Used to register the device on the SIP Server.
<b>Ring Authentication Password</b>	SIP password used to register the device on the SIP Server.
<b>Ring/Alert Event</b> (If Subscribe/Notify selected)	The Ring/Alert Extension is the extension to be monitored for events, and the event of interest (ring or in-use or both) can be selected under Ring/Alert Events. While the event is active, the 8180 will play the audio file selected under the Basic Settings – Ring tab continuously. Custom WAVfiles may be padded with silence to achieve the desired notification frequency.
<b>Page Extension</b>	Extension name that will be monitored to activate the 8180 page auto-answer.
<b>Page Authentication ID</b>	Authentication ID; Used to register the device on the SIP Server.
<b>Page Authentication Password</b>	SIP password used to register the device on the SIP Server.
<b>Different Ports for Extensions</b>	Turn this option ON for certain proxies. For example: Cisco Communication Manager to send ring and page SIP requests through different port numbers

## Ring Tone Settings

Here you can configure ring tone settings.

Basic Settings

Ring Tone warble4-trill.wav Play

Ring Volume 1 Apply

Ring Limit No limit  
1 ring = 6 seconds

Ambient Noise Compensation  Enabled  Disabled

<b>Ring Tone</b>	Select ring tone to play when SIP ring extension is called. This tone can be previewed by pressing the “Play” button.
<b>Ring Volume</b>	Ring volume can be selected and saved, or it can be adjusted live by clicking on “Apply”.
<b>Ring Limit</b>	Set the maximum amount of times the 8180 will ring when activated.
<b>Ambient Noise Compensation (SoundSure™)</b>	When activated, adjusts the ring or page volume relative to ambient noise. For most applications using this setting, it is recommended to first set Ring and/ or Page Volume settings appropriate for a quiet environment (example setting: 3). SoundSure will then adjust the volume upward when ambient noise levels increase. To finalize settings, make sure to test in a loud environment.

More ring settings can be configured under the Advanced Ring tab, see page 35 for more information. A list of compatible SIP servers can be found at [www.algosolutions.com/8180](http://www.algosolutions.com/8180)

<b>Page Volume</b>	Page volume can be selected and saved, or it can be adjusted live by clicking on “Apply”.
<b>Page Mode</b>	<p><b>One-way audio:</b> Transmission only; from the phone to the 8180.</p> <p><b>Talkback:</b> Allow half-duplex communication through the 8180 (direction based on voice detection). The communication can only be initiated from a phone.</p>
<b>Page Timeout</b>	Hang up call after preselected period of time.
<b>Page Tone</b>	Selection of different page tones. Page tones are played before starting the paging. Select “None” to skip playing a page tone. Note: use of the pre-installed Ring Tones as Page Tones is not recommended. Custom files may be uploaded via the Advanced Tones tab, see page 30 for more details.
<b>G.722 Support</b>	Enable G.722 Codec option for wideband paging.
<b>Automatic Gain Control</b>	When activated, applies as much as 12 dB gain to bring speech level to full amplitude with some compression. Recommended for maximum page volume.
<b>Auto Delay</b>	Enter 0-1,000 for page audio delay in milliseconds. Can be used to synchronize audio with other third party audio sources or avoid smearing from other 8180 devices at further distances from a listening location.

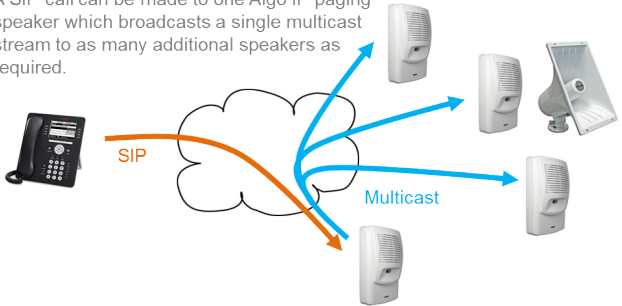

# Multicast Overview

In addition to the ring and page features, the 8180 is able to send and receive IP audio multicast messages over the network to support larger deployment for both paging and ring/notification. This provides a scalable and efficient method of building large scale notification solutions.

## SIP Initiated Multicast Page

A SIP call can be made to one Algo IP paging speaker which broadcasts a single multicast stream to as many additional speakers as required.

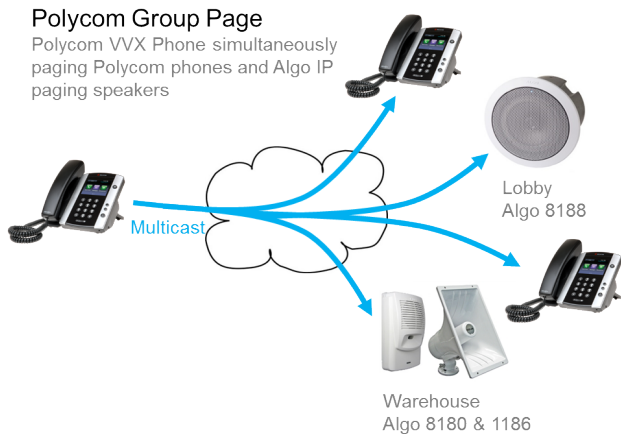

In the diagram above, the bottom 8180 is configured with a SIP Page Extension. When called from a phone, the SIP registered 8180 auto-answers and plays the page audio over its speaker. Simultaneously, the bottom 8180 broadcasts the audio over the network using multicast to as many additional 8180s as required (or 8188 ceiling speakers).

The bottom 8180 is the multicast MASTER and the top 3 are multicast SLAVES. The slave 8180s require a PoE network connection but do not require registration to the communication server.

Multicasting can also be used to distribute loud ring or other alerting (emergency or safety notifications) over multiple 8180s, 8188 Ceiling Speakers, and also 8128 SIP Strobe Lights.

In the diagram below, Algo speakers are configured as multicast slaves supporting Polycom Group Paging and G.722 HD Voice for optimum intelligibility.

## Multicast Technical Information

Each 8180 has its own IP address, and shares a common multicast IP and port number (multicast zone) for multicast packets.

The master unit transmits to a configurable multicast zone, and all the slave units listen to the multicast zones assigned to them. When a master unit receives a valid SIP ring event, it will ring locally and also send out a special packet to the multicast zone. The network switches and router see the packet and deliver it to all the members of the group. When a page audio call occurs, the master unit will transmit all the RTP audio packets to the multicast zone and all the slave units will receive them.

The multicast IP and port number must be the same on all the master and slave units of one group. The user may define multiple zones by picking different multicast IP addresses and/or port numbers.

1. Multicast IP addresses range: 224.0.0.0/4  
(from 224.0.0.0 to 239.255.255.255)
2. Port numbers range: 1 to 65535
3. By default, the 8180 is set to use the multicast IP address 224.0.2.60 and the port numbers 50000-50008

Make sure that the multicast IP address and port number do not conflict with other services and devices on the same network.

**Polycom Group Paging/ Push-to-Talk**

Paging/PTT Mode  Disabled  Group Paging  Push-to-Talk

Default Channel

<b>Multicast Mode (Master Selected)</b>	If master is enabled the 8180 will broadcast an IP stream when activated in addition to playing over its own speaker.
<b>Zone Selection Mode</b>	Single Zone always broadcasts on one IP address. In DTMF mode the IP address is determined by the zone selected

<b>Master Fixed Zone</b>	IP address for multicast broadcast.
<b>Master Ring Mode</b>	If control signal is selected the master 8180 will broadcast a message activating locally selected WAV files in slave 8180s. If audio stream is selected, the master 8180 will broadcast an audio stream using the master's selected ring tone.
<b>Zone Definitions</b>	<p>Multicast IP addresses and ports are configured by default. These typically do not need to be changed unless they conflict with other multicast addresses on the network. If changed they must be changed on all 8180s in the multicast group.</p> <p>Multicast zones are assigned a priority based on the list position. Each 8180 multicast slave will play audio from the highest priority active zone.</p>
<b>Paging/PTT Mode</b>	<p>The 8180 may receive or broadcast multicast paging compatible with Polycom* phones on premise group paging protocol.</p> <p>The 8180 may be configured as a slave to play Polycom page announcements, or as a master to generate page announcements to Polycom phones.</p> <p>When using a Polycom phone as the paging source, the Polycom phone must be set to use the G.711 or G.722 audio codec. Note that the Polycom phone must be configured with the "Compatibility" setting ("ptt.compatibilityMode") disabled in order for this codec setting to be applied.</p>
<b>Default Channel</b>	This is the target group in a Polycom paging environment. Note that you must also use the zone definitions above to select a multicast address, and that this address must match with the one configured on the Polycom phone.

## Priority

Higher priority events will interrupt lower priority events. The priority levels are as follows, from highest to lowest:

*Multicast "Priority Call"*

*SIP Page*

*SIP Ring (all accounts)*

*Multicast "All Call"*

*Multicast "Zone 1"... "Zone 6"*

*Multicast "Music"*

Lower priority events will be restored after higher priority events are completed, with the exception that there is only a single "SIP" state so lower priority SIP events will be ignored and are thus non-restorable. The specific exceptions are as follows:

- SIP Page will interrupt SIP Ring and clear the ring state (thus the Ring will not be restored).
- SIP Ring during SIP Page will be ignored (and thus cannot be restored).
- Subsequent SIP Rings on different accounts while one SIP Ring is active will be ignored (and thus cannot be restored).

### Network Settings

Here you can configure network settings.

**Network Interface**

Protocol	<input checked="" type="radio"/> Static IP <input type="radio"/> DHCP
IP Address	<input type="text"/>
Netmask	<input type="text"/>
Gateway	<input type="text"/>
DNS Server	<input type="text"/>

**802.1Q Virtual LAN**

VLAN Mode	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
VLAN ID	<input type="text" value="0"/> <small>Value range: 0 to 4094</small>
VLAN Priority	<input type="text" value="0"/> <small>Value range: 0 to 7</small>

**Differentiated Services**

SIP (6-bit DSCP value)	<input type="text" value="0"/>
RTP (6-bit DSCP value)	<input type="text" value="0"/>

<b>Protocol</b>	DHCP is an IP standard designed to make administration of IP addresses simpler. When selected, DHCP will automatically configure IP addresses for each 8180 on the network. Alternatively the 8180 can be set to a static IP address.
<b>VLAN Mode</b>	Enables or Disables VLAN Tagging. VLAN Tagging is the networking standard that supports Virtual LANs (VLANs) on an Ethernet

	<p>network. The standard defines a system of VLAN tagging for Ethernet frames and the accompanying procedures to be used by bridges and switches in handling such frames. The standard also provides provisions for a quality of service prioritization scheme commonly known as IEEE 802.1p and defines the Generic Attribute Registration Protocol.</p>
<b>VLAN ID</b>	<p>Specifies the VLAN to which the Ethernet frame belongs. A 12-bit field specifying the VLAN to which the Ethernet frame belongs. The hexadecimal values of 0x000 and 0xFFFF are reserved. All other values may be used as VLAN identifiers, allowing up to 4094 VLANs. The reserved value 0x000 indicates that the frame does not belong to any VLAN; in this case, the 802.1Q tag specifies only a priority and is referred to as a priority tag. On bridges, VLAN 1 (the default VLAN ID) is often reserved for a management VLAN; this is vendor specific.</p>
<b>VLAN Priority</b>	<p>Sets the frame priority level. Otherwise known as Priority Code Point (PCP), VLAN Priority is a 3-bit field which refers to the IEEE 802.1p priority. It indicates the frame priority level. Values are from 0 (lowest) to 7 (highest). These values can be used to prioritize different classes of traffic (voice, video, data, etc).</p>
<b>SIP (6-bit DSCP value)</b>	<p>Can provide quality of service if the DSCP protocol is supported on your network. Can be specified independently for SIP control packets versus RTP audio packets.</p>
<b>RTP (6-bit DSCP value)</b>	
<b>DHCP Timeout (seconds)</b>	<p>Length of time following a request from an 8180 to the DHCP server that the 8180 will wait before assuming the server is not available. After such time, the 8180 will use its default address of 192.168.1.111</p> <p>Default is 60 seconds.</p>

Log Size (1 ~ 1000 kB)	<input type="text" value="100"/>
Log Method	<input checked="" type="radio"/> Local <input type="radio"/> Network <input type="radio"/> Both

### High Availability

Hardware Watchdog	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled
-------------------	-------------------------------------------------------------------------

### Management

SNMP Support (v1 get only)	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled
----------------------------	-------------------------------------------------------------------------

Save

<b>Password</b>	Password to log into the 8180 web interface. You should change the default password in order to secure the device on the network. If you have forgotten your password, you will need to perform a soft reset in order to restore the password (as well as all other settings) back to the original factory default conditions. For information on how to perform a soft reset, see page 11.
<b>Confirmation</b>	Re-enter network admin password
<b>Device Name</b>	Name to identify the device in the Algo Network Device Locator Tool.
<b>NTP Time Server</b>	Allows the 8180 to synchronize to an external time server.
<b>Introduction Section on Status Page</b>	Allows the introduction text to be hidden from the login screen.
<b>Log Level</b>	Use on the advice of Algo technical support only.
<b>Log Size</b>	
<b>Log Method</b>	Allows the 8180 to write to external Syslog server if the option for external (or both) is selected.
<b>Log Server</b>	If external (or both) is selected this is the address of the Syslog server on the network.
<b>Hardware Watchdog</b>	Use on the advice of Algo technical support only.
<b>SNMP Support (v1 get only)</b>	Additional SNMP support is anticipated for future, but the 8180 now responds to a simple status query for automated supervision. Contact Algo technical support for more information.

# Provisioning

Provisioning allows installers to pre-configure 8180 units prior to installation on a network. It is typically used for large deployments to save time and ensure consistent setups.

## Provisioning Settings

Here you can configure settings for provisioning function.

<b>Mode</b>	
Provisioning Mode	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
<b>Settings</b>	
Server Method	<input checked="" type="radio"/> DHCP Option 66 <input type="radio"/> Static
Download Method	<input checked="" type="radio"/> TFTP <input type="radio"/> FTP <input type="radio"/> HTTP
Config Download Path	<input type="text"/>
Firmware Download Path	<input type="text"/>

There are two different Provisioning methods that can be used: via DHCP Option 66 or via a Static Server. In addition, there are three different ways to download provisioning files from a “Provisioning Server”: TFTP (Trivial File Transfer Protocol), FTP, or HTTP.

For example, 8180 configuration files can be automatically downloaded from a TFTP server using DHCP Option 66. This option code (when set) supplies a TFTP boot server address to the DHCP client to boot from.

DHCP must be enabled if using DHCP Option 66, in order for Provisioning to work (see “DHCP” on page 22).

One of two files can be uploaded on the Provisioning Server (for access via TFTP, FTP, or HTTP):

1. generic file `algot8180.conf`, or
2. specific file `algot[MAC].conf`

## MD5 Checksum (TFTP Only)

For TFTP only an .md5 checksum file must also be uploaded to the Provisioning server. This checksum file is used to verify that the .conf file is transferred correctly without error.

A tool can be found at the website address below to generate this file.

<http://www.fourmilab.ch/md5>

The application doesn't need an installation. To use the tool, simply unzip and run the application (md5) from a command prompt. The proper .md5 file will be generated in the same directory.

If using the above tool, be sure to use the “-l” parameter to generate lower case letters.

## Generating a generic configuration file

1. Connect an 8180 on the network
2. Access the 8180 Web Interface Control Panel
3. Configure the 8180 with desired options
4. Click on the System tab and then Maintenance.
5. Click “Backup” to download the current configuration file
6. Save the file settings.txt
7. Rename file settings.txt to algop8180.conf
8. File algop8180.conf can now be uploaded onto the Provisioning server

### Backup / Restore Configuration

Download Configuration File

Backup

Restore Configuration File

Choose File

No file chosen

Restore

Restore Configuration to Defaults

Restore Defaults

If using a generic configuration file, extensions and credentials have to be entered manually once the 8180 has automatically downloaded the configuration file.

## Generating a specific configuration file

1. Follow steps 1 to 6 as listed in the section “Generating a generic configuration file” on page 36.
2. Rename file settings.txt to algom[MAC address].conf (e.g. algom0022EE020009.conf)
3. File algom[MAC address].conf can now be uploaded on the Provisioning server.

The specific configuration file will only be downloaded by the 8180 with the MAC address specified in the configuration file name. Since all the necessary settings can be included in this file, the 8180 will be ready to work immediately after the configuration file is downloaded. The MAC address of each 8180 can be found on the back label of the unit.

## Ring Tones - Loading/Replacing

During the Provisioning process, the 8180 will try to download a file called `algop8180-tones.md5`. If the file exists, the 8180 will compare that file to its internal file. If the files do not match, the 8180 will load a compressed file called `algop8180-tones.zip` that contain all the new or replaced tones, decompress it, and add the tones to the 8180 list.

New tones (that have new names) will be added to the list. New tones that have the same names as ones already in the list will be replaced.

To generate a ring tones file that the 8180 can use to update or add ring tones:

1. Use compression software to generate the `algop8180-tones.zip` file.
2. Add the new ring tone files to this file.
3. Use an MD5 generator (see “MD5 Checksum” on page 27) to generate a file called `algop8180-tones.md5` from the `algop8180-tones.zip` file created above.

# Tones

## Tone Management

Here you can manage all the tone files.

### Tones

File List

- bell-na.wav, 187 kB
- bell-uk.wav, 100 kB
- buzzer.wav, 187 kB
- chime.wav, 187 kB
- dogs.wav, 357 kB
- gong.wav, 187 kB
- page-notif.wav, 23 kB
- warble1-low.wav, 187 kB
- warble2-med.wav, 187 kB
- warble3-high.wav, 187 kB
- warble4-trill.wav, 187 kB

Total Size 1976 kB

Play Selected Tone

Delete Selected Tone

Rename Selected Tone to

### Upload

Upload New Tone File

 8KHz/16KHz, 16-bit, Mono, PCM/u-law WAV File, or such files in zip format. Please limit the file name to 32 characters, and no spaces.

Auto Sound Level

Compression (u-law)

Max Available Space: 1448 KB

<b>File List</b>	This shows all the audio files currently on the 8180. Select to play, rename or delete the file. Note that limited storage is available on the device.
<b>Play Selected Tone</b>	
<b>Delete Selected Tone</b>	
<b>Rename Selected Tone to</b>	
<b>Upload New Tone File</b>	Files must be 8KHz/16KHz, 16-bit, Mono, PCM/u-law WAV File only.
<b>Auto Sound Level</b>	When selected, will maximize the volume of the sound file during the upload process.
<b>Compression (u-law)</b>	Reduces file size to maximize storage when selected.

# Advanced Ring/Alert Settings

## Advanced Ring/Alert Settings

Here you can configure advanced ring/alert settings. The Rule-based Ring Tone uses [Extended POSIX Regular Expression](#) to define rules to match the SIP From field or the extension in "Subscribe/Notify" event mode.

### More Ring Extensions

#2 Ring Extension	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
Extension	<input type="text"/>
Authentication ID	<input type="text"/>
Authentication Password	<input type="text"/> 
Ring Tone	<input type="text" value="&lt;Use Default Ring Tone&gt;"/>
#3 Ring Extension	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled
#4 Ring Extension	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled
#5 Ring Extension	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled

### Rule-based Ring Tone

#1 Custom Tone	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
Rule	<input type="text"/>
Delay (seconds)	<input type="text" value="0"/>
Ring Tone	<input type="text" value="warble2-med.wav"/>

<b>Ring Extension</b>	Additional SIP Ring Extensions may be assigned with unique ring tones.
<b>Extension</b>	See definition on page 13.
<b>Auth ID</b>	See definition on page 13.
<b>Ring Tone</b>	Select which ring tone will be played when the SIP extension is called.
<b>Custom Tone</b>	Enable to select Ring Tone based on Caller ID and/or add delay before Ring Tone begins. Applies to all SIP Ring Extensions. Note Caller ID may be set to "Any" if only a delay is desired.

<p><b>Rule</b></p>	<p>The Rule field uses the POSIX Extended “Regular Expression” format to allow maximum flexibility. Note that the double quote characters are used below to show the start and end of the examples, and must NOT be entered in the Rule field.</p> <p>1)“^” means that the text must be at the beginning of the Caller ID string. So “^Group1” matches all strings that start with the text “Group1” (e.g. “Group1 555-123-4567”).</p> <p>2)“\$” means that the text must be at the end of the Caller ID string. So “123\$” matches all strings that end with “123” (e.g. “Steve 123”).</p> <p>3)For an exact match, use both of the above. Thus “^Steve\$” matches only the string “Steve”</p> <p>4)If none of the special character above are used, then it will match the text anywhere in the string. So a Rule of just “Steve” will match both “123 Steve” and “Steve 123”.</p> <p>5)For a default case, use “.*” which matches everything (any number of any characters), including blank.</p> <p>6)There is one special case: a blank Rule string does not match anything, so is the same as using the Disabled setting</p> <p>Rules are tested starting at Custom #1, so the first rule to match determines the ring tone file that is played. If no rules match, then the default tone in Basic Settings - Ring is played.</p>
<p><b>Delay (seconds)</b></p>	<p>This option allows time to answer a phone before loud ringing over the 8180 begins.</p>

# Input/Output

## Input/Output Settings

Here you can configure input/output function.

### Output

Speaker Mode  Auto  External  Internal  Disabled

Relay Mode  Both  Ring  Page  Disabled

Message Waiting Light  None  On  Flash

Heartbeat Light  Enabled  Disabled

Page Light  Enabled  Disabled

### Input

Speaker Terminal Function  Speaker Output  Relay Input

Relay Input Polarity  Normally Open Contact  Normally Closed Contact

Ring Tone

Ring Duration  Play Once  Play While Held  Call to Cancel

Program Buttons  Enabled  Disabled

<b>Speaker Mode</b>	Auto: Detect automatically if an external speaker is connected to the 8180. External/Internal: Manually select which speaker to use. Disabled: No audio
<b>Relay Mode</b>	Relay activation: Ring, Page, Both, or disabled. Relay can trigger external light or other device when specified event occurs.
<b>Message Waiting Light</b>	If enabled the blue indicator will activate when there is a message waiting signal on the line. Function available if supported by the SIP server.
<b>Heartbeat Light</b>	If enabled the blue indicator will flash every 30 seconds as visual confirmation of PoE power and SIP server registration.

<b>Page Light</b>	If enabled then the blue indicator will be on during paging. If talkback is enabled then the page light will flash when the microphone path is active.
<b>Speaker Terminal Function</b>	When no external speaker is required, the function for detecting an external speaker may be re-configured to detect an external dry contact relay; either normally open or normally closed. If detected, the 8180 will activate as if a ring signal were received to initiate both WAV file playback and multicast broadcast (if enabled).
<b>Relay Input Polarity</b>	Select option to match connection type.
<b>Ring Tone</b>	Selection of files that can be played when relay detect is activated.
<b>Ring Duration</b>	<p>“Play once” will play the selected WAV file once to completion.</p> <p>“Play while held” will play the selected WAV file repeatedly while the input is triggered.</p> <p>“Call to Cancel” changes the behavior of the ring extension such that it will cancel the playback activation. In this mode the tone will continue to be played after the relay is deactivated until the 8180’s ring extension is called.</p>
<b>Program Buttons</b>	The buttons on the unit can be disabled to avoid tampering.

# Advanced SIP Settings

## Advanced SIP Settings

Here you can configure more SIP settings.

### SIP

Outbound Proxy	<input type="text"/>
STUN Server	<input type="text"/>
Register Period (seconds)	<input type="text" value="3600"/>
Keep-alive Method	<input checked="" type="radio"/> None <input type="radio"/> Double CRLF

### Server Redundancy

Server Redundancy Feature (Multiple SIP Server Support)	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
Backup Server # 1	<input type="text"/>
Backup Server # 2	<input type="text"/>
Polling Interval (seconds)	<input type="text" value="120 seconds (2 minutes)"/> <span>▼</span> <small><b>i</b> Time period between sending monitoring packets to each server. Non-active servers are always polled, and active server may optionally be polled (see below).</small>
Poll Active Server	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled <small><b>i</b> Explicitly poll current server to monitor availability. May also be handled automatically by other regular events, so can be disabled to reduce network traffic.</small>
Automatic Failback	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled <small><b>i</b> Reconnect with higher priority server once available, even if backup connection still fine.</small>
Polling Method	<input checked="" type="radio"/> SIP NOTIFY <input type="radio"/> SIP OPTIONS <small><b>i</b> SIP message used to poll servers to monitor availability.</small>

<b>Outbound Proxy</b>	IP address for outbound proxy. A proxy (server) stands between a private network and the internet.
<b>STUN Server</b>	IP address for STUN server if present.
<b>Register Period (seconds)</b>	Maximum requested period of time where the 8180 will re-register with the SIP server. Default setting is 3600 seconds (1 hour). Only change if instructed otherwise.
<b>Keep-alive Method</b>	If Double CRLF is selected the 8180 will send a packet every 30 seconds (unless changed) to maintain connection with the SIP Server if behind NAT.
<b>Server Redundancy Feature</b>	Two secondary SIP servers may be configured. The 8180 will attempt to register with the primary server but switch to a secondary server when necessary. The configuration allows re-registration to the primary server upon availability or to stay with a server until unresponsive.
<b>Backup Server #1</b>	If primary server is unreachable the 8180 will attempt to register with the backup servers. If enabled the 8180 will always attempt to register with the highest priority server.
<b>Backup Server #2</b>	
<b>Polling Intervals (seconds)</b>	Time period between sending monitoring packets to each server. Non-active servers are always polled, and active server may optionally be polled (see below).
<b>Poll Active Server</b>	Explicitly poll current server to monitor availability. May also be handled automatically by other regular events, so can be disabled to reduce network traffic.
<b>Automatic Failback</b>	Reconnect with higher priority server once available, even if backup connection still fine.
<b>Polling Method</b>	SIP message used to poll servers to monitor availability.

Upgrade

 Upgrade

<b>Download Configuration File</b>	Save the device settings to a text file for backup or to setup a provisioning configuration file.
<b>Restore Configuration File</b>	Restore settings from a backup file.
<b>Restore Configuration to Defaults</b>	Resets all 8180 device settings to factory default values.
<b>Reboot the Device</b>	Reboots the device.
<b>Firmware Image</b>	This is the firmware image and checksum as provided by Algo
<b>MD5 Checksum</b>	

# Upgrade 8180 Firmware

1. From the top menu, click on System, then Maintenance.

2. In the Maintenance section, click Reboot

Wait 30-60 seconds for the device to reboot and the web page to automatically reload.

3. Login to the device again, and click on System.
4. In the Upgrade section, click on Choose File and select the 8180 firmware file to upload. Note that both the FW firmware and MD5 checksum files must be loaded.

5. Click Upgrade
6. After the upgrade is complete, confirm that the firmware version has changed (refer to top right of Control Panel).

## FCC Compliance

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures: 1) Reorient or relocate the receiving antenna, 2) Increase the separation between the equipment and receiver, 3) Connect the equipment into an outlet on a circuit different from that to which the receiver is connected, or 4) Consult the dealer or an experienced radio/TV technician for help.

## Important Safety Notice

The 8180 is intended for installation in a dry indoor location with all connected wiring located within the perimeter of a building.

The 8180 is a Power over Ethernet (PoE) device. The PoE power source must be a Limited Power Source (LPS), provided by CAT5 UTP cable, and isolated from mains by minimum reinforced or double insulation. Ensure that the PoE injector or PoE enabled switch carries safety regulatory approval marks (ie CSA, UL, CE).
